DEJ SOFTWARE™

PHAROS DATA ARK

Software / bootstrap kit

The downloadable kit supplies software and public collection configuration. You supply the host and storage. It is not a complete operating-system image and does not include the public collection.

> **Setup authorization:** use the trusted local installer or host terminal. No separate activation code is needed after owner credentials are set. If browser setup is deferred on a shared network, prepare a fresh private pairing code first.

What you need

- A supported Linux installation, administrative access, storage and internet for installation.
- The verified bootstrap kit and its matching README.

First start

1. Download the kit and checksum from the DEJ Software bootstrap page or the Ark's DEJ Software collection.
2. Extract the kit onto a formatted content drive or the installation location described by its README.
3. Review the preview, select the platform profile and library location, then complete installation with local administrative authorization.
4. Set credentials in the trusted installer. If you deliberately defer first-owner setup to a browser, prepare a unique code and supply it privately before exposing that setup page.

Browsing installed content needs no password. No online activation, registration or DEJ Software account is required.

Operating notes

- Original Raspberry Pi provides the optional hotspot appliance profile. LAN-only Debian hosts serve an existing wired or Wi-Fi network.
- Content acquisition is separate from installing the software; choose only the collections that fit.

Further help

The complete handbook is included with the Ark. Online: dejsoftware.com/data-ark/docs/.

On an installed appliance, use System / System / Power before disconnecting power or removing storage. Containers use their host controls.
