DEJ SOFTWARE™

PHAROS DATA ARK

Linux LAN server

A Data Ark can serve an existing local network from a supported Linux server or laptop. A Wi-Fi access point is optional, and a Pi is not required for this profile.

> **Setup authorization:** use the trusted local installer or host terminal. No separate activation code is needed after owner credentials are set. If browser setup is deferred on a shared network, prepare a fresh private pairing code first.

What you need

- A supported Debian-based host, administrative access and an existing wired or Wi-Fi network.
- Library storage and internet for installation dependencies.

First start

1. Use the supported bootstrap workflow and select the LAN profile. Preserve the host's existing network configuration.
2. Choose a library location or attach an existing content drive. Set the caretaker password through the trusted local installer.
3. Open the host's LAN address in a browser and check the dashboard, Help and installed readers.
4. Use the host's existing Linux account credentials for SSH. There is no extra activation code after owner credentials have been established.

Browsing installed content needs no password. No online activation, registration or DEJ Software account is required.

Operating notes

- A LAN server does not need a hotspot, a second Wi-Fi adapter or Raspberry Pi-specific hardware.
- If ownership is handed to someone else with browser setup deferred, generate a fresh private pairing code through recipient preparation.

Further help

The complete handbook is included with the Ark. Online: dejsoftware.com/data-ark/docs/.

On an installed appliance, use System / System / Power before disconnecting power or removing storage. Containers use their host controls.
